## Introduction

Patient rights; It forms a sub-title of human rights and is among the basic rights that human beings have gained from birth. We aim to evaluate how much basic patient rights such as the right to request information, the right to refuse, the right to stop, the right to be respected and respected, and in particular to privacy, are known by our healthcare professionals, and how much they are implemented and their attitudes.

## Materials and Methods

In our study, a cross-sectional research will be carried out in the field of health. The health workers working in Bezmialem Vakif University Hospital will be selected and a study group will be formed. In the data collection process, a 25-question questionnaire with 'yes' 'no' answers will be used, which was created by the researchers by scanning the literature. Knowledge score will be calculated from 25 questions prepared to measure the knowledge level of healthcare professionals about patient rights. The highest and lowest scores will be determined. A high score will indicate a high level of knowledge.

## Results

Of the 50 participants participating in the study, 25 were men, 25 were women, and the mean score of patients' rights was  $86.88 \pm 9.697$  for men and  $81.76 \pm 8.253$  for women. According to gender, it was determined that the knowledge level of men was higher than women ( $p=0.021$ ). No significant results were found by occupation.

## Conclusion

Although the level of knowledge is better for men than for women, it would be good for both genders to continue their education.
